EXPERIMENT NO. 11: HOME FINDER ONLINE REAL ESTATE PLATFORM

AIM:

To develop the Home Finder real estate web application allowing buyers and renters to search residential/commercial properties by locality and budget, save custom search criteria, view geo-coordinates, and book property site visits.

PSEUDOCODE (IN 6 SIMPLE POINTS):

Step 1: Initialize property database with listings containing property type, locality, price, area (sq.ft), and GPS coordinates.

Step 2: Display an advanced search filter supporting criteria selection: Buy vs Rent, property configuration (1BHK, 2BHK, Villa), and budget limits.

Step 3: Allow registered buyers to save their preferred search criteria to avoid repeatedly entering filter preferences.

Step 4: Render comprehensive property cards featuring high-resolution images, virtual walkthrough links, and simulated Google Maps location pins.

Step 5: Provide an interactive booking form for prospective clients to schedule in-person site viewings with assigned real estate agents.

Step 6: Equip admin with controls to add new properties, update pricing, and maintain visitor enquiry logs.

```

Output:

RESULT:

Thus, the Home Finder real estate platform was successfully created and verified, implementing property criteria filtering, saved buyer search preferences, GPS coordinates display, and site visit scheduling.
